NAIROBI

OCTOBER, 2020

MARKET SURVEY NOTES

A. Survey Coverage

1. The market survey for collection of prices was carried out in fifteen (15) towns from 16th to 23rd July, 2020.

B. Calculation of Average Prices for Different Towns

2. Five outlets were targeted per category in all towns apart from Nairobi where prices for each category were collected from ten outlets.

3. Data entry and cleaning was done to pave way for analysis. During analysis, four variables were calculated; namely geometric mean, standard deviation, coefficient of variation and the count. These variables were calculated as follows:

-

- a) The **Geometric mean** of prices was calculated by getting the product of their values and taking the n th root of the product (as opposed to the arithmetic mean which uses their sum of their values divided by n) where n refers to the number of observations.
- b) The **standard deviation** is a measure of dispersion was calculated to show how far data sets deviate from the group mean.
- c) The **Coefficient of Variation (CV)**, is a measure of spread that describes the amount of variability relative to the mean and is calculated by dividing the standard deviation by the mean and multiplying by 100. For this survey, a CV value of 35 was used to identify and eliminate outliers. If the value of the calculated CV was more than 35, the highest or lowest price for the item was removed. This process was repeated iteratively until the calculated CV was 35 or less.
- d) The **Count** is the number of valid prices which were used to calculate the mean.

4. Once the calculated value of CV was 35 or less, then the mean was reported if: -

- a) In each town, the count of valid prices was 2 or more.

- b) For the overall mean price (all column), the count of valid prices in all towns was 7 or more. If cases where there were less than 2 prices for a specific item in a town, then the mean price for the item was viewed as prone to bias and was therefore excluded from the report.
- c) Similarly, if the total number of observed prices for all towns for an item was found to be less than 7, then the overall mean for that item is not reported.
5. The overall mean price (all column) in this report is the mean for all valid prices for that item, including the prices which were valid but were not used to calculate the mean for the item in the town because the number of prices was less than 2.
6. For instance, if two towns reported one prices each for an item, the mean price for this item in the towns was not reported. If another three towns reported 3, 2, and 4 prices respectively for the same item then the mean price for this item was reported for the three towns.
7. The overall mean for this item will be based on 11 prices (i.e. $1 + 1 + 3 + 2 + 4$) since this are the valid prices for this item. In short the overall mean is based on all valid prices of that item and is not equal to the average of the five means for each town.
8. For towns where the mean price is not reported, the overall mean price becomes applicable for that town. This means that if we have the overall mean price for an item, then all towns have a mean price for the item.
9. For items without prices both at the town level and the all column, such items **were not available** during the survey or the **prices were not adequate** to generate average prices. The procuring entity or stakeholders applying the results should undertake confirmation with the market through market survey.

10. The prices are indicative and therefore in making a procurement decision in relation to the market price index, the procuring entity shall take into consideration the provisions of Regulation 43(4) of the Public Procurement and Asset Disposal Regulations, 2020.

11. The brand names were solely mentioned to emphasize the specificity of the survey. **Therefore, the stated brand names are not an exclusive recommendation or prescription by PPRA to public entities, but are merely mentioned for the purpose of information**

1. PHARMACY
